Title : Before vs. After – Behavioural Transformation

Name of the student: Poorvi Sharma

Enrollment No. : BTE25CSE000163

Program: B.Tech CSE

Semester: III Sem.

Signature of Student: _____

Signature of Internal Examiner: _____

Signature of External examiner: _____

Before vs. After – Behavioural Transformation

Project 3 | Professional Development III (Behavioural Skills)

1. Introduction and Objectives

This project, **Before vs. After – Behavioural Transformation**, presents the improvement of a technically capable but behaviourally ineffective employee through the application of five behavioural skill areas. The fictional employee, Rahul, works in a software company where project tasks require regular coordination, discussion and shared decisions. Although Rahul has technical ability and dedication, his communication difficulties, fixed responses to feedback and emotional reactions affect teamwork and professional growth.

The project demonstrates that technical competence alone is not sufficient for workplace effectiveness. Creativity, etiquette, growth mindset, emotional intelligence and conflict resolution influence how an employee contributes to a team and responds to challenges.

Learning objectives

- To identify behavioural issues that can reduce an employee's professional effectiveness.
- To apply the five PD-III units to realistic workplace situations.
- To show how specific behavioural interventions can change day-to-day actions.
- To identify observable outcomes such as respectful communication, better decisions and constructive conflict handling.
- To reflect on personal behaviour that can be improved in academic and professional group settings.

2. Professional Scenario / Problem Statement

Rahul is a software employee in a team-based project environment. He is technically capable and dedicated, but his behaviour creates difficulties during meetings and collaborative work. He rejects new ideas, interrupts colleagues, takes criticism personally, reacts emotionally under pressure and escalates disagreements. These behaviours reduce trust, restrict the exchange of ideas and make problem-solving more difficult.

Problem statement: Rahul's technical strength is not being matched by effective interpersonal behaviour. He needs to develop the behavioural skills required to communicate respectfully, learn from mistakes, manage emotions and resolve disagreements constructively.

Causes and triggers

- Lack of communication skills and active listening.
- Low confidence and fear of judgement.
- A fixed mindset that treats mistakes as personal failure.
- High stress during team situations.
- Difficulty regulating emotional reactions.

Key observations

- Rahul has technical skills and dedication.
- He lacks some interpersonal and communication skills.
- He becomes stressed easily in team situations.

• The same employee can produce different workplace outcomes when his mindset and behaviour change.

3. Application of the Five Units

Unit I – Creativity

Concept: Creativity involves generating more than one possible solution before selecting the most suitable option. It supports flexible thinking and practical problem-solving.

Application: During a team meeting, Rahul is asked to solve a project delay. Instead of insisting on his first idea, he brainstorms three possible options: redistribute tasks, simplify a non-essential feature, or revise the work sequence. The team compares the options and selects the most practical response.

Key takeaway: More ideas create a wider choice and can lead to better decisions.

Unit II – Etiquette

Concept: Workplace etiquette means communicating and behaving respectfully and professionally. Listening without interrupting is an important part of professional communication.

Application: Rahul allows colleagues to finish speaking, listens carefully, uses respectful language and responds to the point being discussed rather than reacting personally.

Key takeaway: Good communication builds trust and makes teamwork smoother.

Unit III – Growth Mindset

Concept: A growth mindset is the belief that abilities can improve through learning, effort, practice and feedback.

Application: Rahul replaces the fixed statement “I cannot do this” with “I can improve with practice.” When a task does not go well, he identifies what went wrong, asks for feedback and tries a revised approach.

Key takeaway: Effort, feedback and learning from mistakes support growth.

Unit IV – Emotional Intelligence

Concept: Emotional intelligence includes recognizing and managing one's emotions and understanding the feelings and perspectives of others.

Application: When Rahul receives criticism or faces pressure, he pauses before responding, identifies what he is feeling, avoids an impulsive reaction and considers the other person's point of view.

Key takeaway: A calm mind supports better decisions and healthier professional relationships.

Unit V – Conflict Resolution

Concept: Conflict resolution uses discussion, negotiation and, when needed, mediation to address disagreements and reach workable solutions.

Application: When Rahul disagrees with a colleague, he listens to both sides, identifies the shared goal, discusses possible options and suggests a compromise that supports the project. If the disagreement remains unresolved, a neutral team lead can help mediate.

Key takeaway: Healthy conflict handling can strengthen teams instead of damaging working relationships.

4. Integrated Solution / Proposed Model

The five units work together as a connected behavioural improvement model. Creativity helps Rahul generate alternatives; etiquette allows him to exchange those ideas respectfully; a growth mindset helps him accept feedback and learn; emotional intelligence helps him manage reactions; and conflict resolution helps the team reach an agreed way forward.

Stage	Action by Rahul	Behavioural result
Identify the issue	Recognize the effect of interrupting, rejecting ideas and reacting emotionally.	Greater self-awareness.
Generate options	Brainstorm alternatives before choosing a solution.	More flexible problem-solving.
Communicate respectfully	Listen fully and respond professionally.	Improved trust and teamwork.
Learn and regulate	Use feedback and pause before reacting.	Improved self-management.
Resolve disagreement	Discuss interests and negotiate a workable solution.	Constructive collaboration.

A practical improvement cycle is: **Recognize behaviour** → **Apply the relevant skill** → **Practise in daily work** → **Seek feedback** → **Review progress** → **Reinforce positive behaviour.**

5. Expected Outcomes

- Rahul considers alternatives instead of rejecting ideas immediately.
- He communicates respectfully and allows others to speak.
- He treats feedback as an opportunity to improve.
- He manages emotional reactions more effectively under pressure.
- He discusses disagreements and works towards solutions.
- Teamwork, decision-making, confidence and professional growth are expected to improve.

Progress can be observed through fewer interruptions in meetings, more ideas considered before decisions, constructive responses to feedback, fewer emotionally escalated disagreements and clearer follow-through on agreed actions.

6. Conclusion and Personal Reflection

The project shows that professional effectiveness depends on both technical ability and behavioural skills. Rahul's transformation does not require changing his technical identity; it requires improving the way he communicates, learns, manages emotions and works with others. Applying all five units in everyday situations can create more respectful collaboration and better workplace decisions.

Personal reflection

Reflection prompt	Response
One concept understood better	Emotional intelligence.
One behaviour to improve	Not interrupting others and listening until they finish.
One situation to apply the learning	Team meetings and group discussions.

7. References and Project Visuals

1. Professional Development III (Behavioural Skills), End-Semester Practical Examination – Project & Viva Guidelines, SAGE University, Academic Session 2026–27.
2. Professional Development III course notes and classroom learning for Units I–V (as applicable).

The two chartsheets titled “Before vs. After – Behavioural Transformation” (Chart 1: Diagnosis & Concepts; Chart 2: Application & Solution) form the visual component of this report and should be attached after this section when submitting the printed file.

8. Project Alignment and Viva Readiness

The project follows the approved Project 3 structure. Chart 1 identifies Rahul's workplace situation, behavioural issues, causes and the five unit concepts. Chart 2 shows the five interventions, the before-and-after comparison, action plan, expected outcomes and reflection. For the viva, the student should be able to explain why each intervention suits Rahul's situation and give a practical example of how the behaviour can be observed in a team setting.

Viva summary: Rahul changes from rejecting ideas, interrupting others and escalating disagreements to considering alternatives, communicating respectfully, learning from feedback, managing emotions and resolving disagreements constructively.
